TRUarchive

TRUarchive for TrackWise

Archiving is a common requirement for any GxP system and is an important part of your QMS strategy. However, a TrackWise database can be complex, making it difficult to accurately extract archived information and to interpret it once extracted. This can cause project delays and unnecessary challenges when you need to:

- Decommission legacy systems
- Free up your production environment by archiving historical projects and systems
- Increase the performance of your production TrackWise system

TRUarchive enables configurable migrations to any archive target technology, with built-in features that are specifically designed for the TrackWise data structure and data types.

TRUarchive Benefits:

- Accurate, efficient and cost-effective way to archive historical data

- Peace of mind in choosing the appropriate archive platform for your needs

- Configurable definition of archive keys and data

- Multi-value fields flattened to a single row per PR data for easy viewing and reporting

- ID-to-name translation

- Automatic PDF generation on the fly

Find the archiving solution that works for you

Whether you choose to maintain your TrackWise user interface or move archive records and documents to another platform, Valiance has the know-how to deliver an effective TrackWise archival migration. Since our first TrackWise archive nearly 10 years ago, Valiance has cultivated the experience and software to manage even the most complicated challenges effectively.

A current TrackWise user can benefit from archiving within TrackWise, and one TrackWise archive can hold archived data from multiple source systems. We offer an assessment of other possible archive targets based on our broad experience with many different GxP platforms and best practices to search and retrieve archived data.

TRUarchive

TRUarchive is as simple as 1-2-3.

1 CONFIGURE - Mappings and archive criteria are easily set using the TRUarchive configuration console interface. This easy-to-use system helps to ensure all project goals and requirements are met from the get-go. The archiving process is fully documented based on a mutually defined Archive Specification and, if needed, 100% validation through our TRUcompare migration validation software and processes.

2 ARCHIVE - TRUarchive extracts historical content and metadata from one or more source repositories, converts it to PDF as needed, then loads transformed objects into archive file share, database or application. It's entirely possible to configure a TRUarchive solution for ongoing execution to support periodic archiving.

3 DELETE - If necessary, TRUarchive can delete historical records and documents that have successfully migrated to the archival system, freeing up storage in your database while increasing performance.
